At the top, there's a navigation bar with 'My Library: PT Pinarif Khairisma Pratama', 'Change Database', 'English', and user login options. Below this is the article title 'Extinction and the U.S. Endangered Species Act'. The authors listed are Noah Greenwald, Kieran F. Suckling, Brett Hartl, and Loyal A. Mehrhoff, dated Apr 22, 2019. The document is from Peer2 (Vol. 7) published by Peer2 Ltd. The document type is an article, 1,821 words long, with a DOI of 10.7717/peer.8803. On the left, there are interactive features for Translate, Font Size, and Listen. The main text includes an introduction about the U.S. Endangered Species Act (ESA) passed in 1973, discussing its impact on species recovery and opposition from industry groups. It also mentions that the number of delistings is a poor measure of success because many species have not been protected for long enough. The article concludes by stating that previous studies indicate the ESA has been successful in preventing species extinction, with at least 227 species and the number of species delisted due to recovery outnumbering the number of species delisted for extinction by 14-7.

**Extinction and the U.S. Endangered Species Act**

Authors: Sean Greenwald, Karen T. Suckling, Beth Ford and David S. Schwartz  
Date: Apr 22, 2019

Document Type: Article  
Length: 1,007 words  
DOI: 10.1080/00004222.2019.1600000

Introduction

Passed in 1973, the U.S. Endangered Species Act (ESA) has protected and recovered species and has helped restore and recover hundreds of native species, such as the bald eagle and gray whale (Taylor, Suckling & Reckhow, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common claim from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Sedore, 2013).

The number of delisting requests is a good measure of the success of the ESA because listed species have not been protected for sufficient time such that they would be expected to have recovered (Suckling et al., 2016). For example, birds that are average listed birds had been protected just 26 years, but their federal recovery plans estimated an average of 63 years for recovery. Short of recovery, a number of studies have found the ESA to be effectively maintaining or improving the status of species, using both formal status assessments produced by the U.S. Fish and Wildlife Service for Congress and abundance trends (Maki & Dean, 2005; Taylor, Suckling & Reckhow, 2005; Udois & Coiro, 2012; Suckling et al., 2016).

In addition to recovering species, one of the primary purposes of the ESA is to prevent species extinction. Previous studies indicate the ESA has been successful in this regard (McManis & Wilcove, 1994; Scott et al., 2005). As of 2008, the ESA was estimated to have prevented the extinction of at least 221 species and the number of species delisted due to recovery substantially exceeded the number of species delisted for extinction by 14.7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly

### Introduction

Passed in 1973, the U.S. Endangered Species Act (ESA) includes strong protections for listed threatened and endangered species and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachinski, 2005; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to species protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013).

The number of delistings, however, is a poor measure of the success of the ESA because most species have not been protected for sufficient time such that they would be expected to have recovered. Suckling et al. (2016), for example, found that on average listed birds had been protected just 36 years, but their federal recovery plans estimated an average of 63 years for recovery. Short of recovery, a number of studies have found the ESA is effectively stabilizing or improving the status of species, using both biennial status assessments produced by the U.S. Fish and Wildlife Service for Congress and abundance trends (Male & Bean, 2005; Taylor, Suckling & Rachinski, 2005; Gibbs & Currie, 2012; Suckling et al., 2016).

In addition to recovering species, one of the primary purposes of the ESA is to prevent species extinction. Previous studies indicate the ESA has been successful in this regard (McMillan & Wilcove, 1994; Scott et al., 2006). As of 2008, the ESA was estimated to have prevented the extinction of at least 227 species and the number of species delisted due to recovery outnumbered the number of species delisted for extinction by 14:7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly extinct to quantify the number of species for which ESA protections have failed and use these figures to update the estimated number of species extinctions prevented. This is the first study in over 20 years to compile data on extinction of ESA listed species, providing an important measure of one of the world's strongest conservation laws (McMillan & Wilcove, 1994).

### Methods

To identify extinct or possibly extinct ESA listed species, we examined the status of all 1,747 (species, subspecies and distinct population segments) U.S. listed or formerly listed species, excluding species delisted based on a change in taxonomy or new information showing the original listing to have been erroneous. We determined species to be extinct or possibly extinct based on not being observed for at

by 14:7 (Scott et al., 2006). In this study, we identified all ESA listed species that are extinct or possibly

The screenshot shows a web browser displaying a document from Gale Academic OneFile. The document title is "Extinction and the U.S. Endangered Species Act". A notification box in the center of the page states: "COMPLETE Document(s) have been sent to Google Drive and will appear shortly." with an "Ok" button. The page content includes author information (Noah Greenwald, Kieran J. Hall, and A. Mehrhoff), a date (Apr 22, 2019), and an introduction section. The introduction text is partially highlighted in green and reads: "Passed in 1973, the U.S. Species Act (ESA) includes strong protections for listed threatened and endangered species, and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2006; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to ESA protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013)." The browser's taskbar at the bottom shows the Windows logo, a search bar, and various application icons. The system tray on the right indicates the time is 2:45 PM on 05-Aug-19.

### Introduction

Passed in 1973, the U.S. Species Act (ESA) includes strong protections for listed threatened and endangered species, and has helped stabilize and recover hundreds of listed species, such as the bald eagle and gray whale (Taylor, Suckling & Rachlinski, 2006; Schwartz, 2008; Suckling et al., 2016). In part because of its strong protections, the ESA has engendered substantial opposition from industry lobby groups, who perceive the law as threatening their profits and have been effective in generating opposition to ESA protections among members of the U.S. Congress. One common refrain from opponents of the ESA in Congress and elsewhere is that the law is a failure because only 2% of listed species have been fully recovered and delisted (Bishop, 2013).
